EXPERIENCE

Cybersecurity Engineering Intern

FTI Defense (Frontier Technologies Inc.)

Aug 2022 – Jan 2023

Chesapeake, VA (Remote)

- Architected and operated enterprise red team environment across 6 ESXi hosts with 15+ VMs, centrally managed via vCenter; conducted vulnerability assessment using Nmap and Nessus across blue team infrastructure.
- Built Windows Server 2019 AD domain (primary/secondary DCs) with GPO, Kerberos authentication, and account lockout policies across domain-joined Windows and Linux endpoints.
- Deployed Graylog SIEM on CentOS 8 for centralized log aggregation, integrating Windows (Sidecar) and Linux (Syslog) telemetry and monitoring alert pipelines for suspicious activity across heterogeneous infrastructure.
- Executed penetration testing lifecycle including SSH brute force, command injection, credential extraction, and reverse TCP shell - analyzing attacker telemetry through Graylog to validate detection visibility.
- Produced formal DoD-aligned penetration test report with exploitation evidence and remediation guidance; maintained offensive tooling in private GitHub repository supporting DoD/Navy cyber training.

Information Technology / Security Intern

TTM Technologies

Jun 2022 – Jun 2023

Littleton, CO

- Supported SSO (Duo) authentication rollout across 20+ internal applications, enabling centralized access control and reducing redundant authentication across 250+ users.
- Hardened internal C-based SQL query system using parameterized queries to mitigate injection vulnerabilities.
- Redesigned internal intranet platform using front-end with access-controlled routing, session management, and input validation to strengthen application security; improving performance by ~35% and increasing reported user satisfaction by ~52% across internal tooling.

Mines OreSec (University Cybersecurity Club) Member

Aug 2024 – Aug 2025

- Engaged in competitive CTF scrimmages, industry-led tech talks, and live workshops, focused on building real-world cybersecurity skills including threat detection, vulnerability analysis, and secure system practices.

TECHNICAL SKILLS

SIEM & Detection Engineering: Sentinel · Splunk · Graylog · Sigma · KQL · SPL · Sysmon · MITRE ATT&CK

Security Operations: Threat Hunting · Incident Response · SOC Analysis · SIEM Correlation · NIST

Endpoint & Network Security: CrowdStrike · Defender XDR · Palo Alto · Suricata · Windows AD · DNS

Cloud & Identity Security: Azure · AWS · GCP · Okta · IAM · CloudTrail

Penetration Testing: Kali Linux · Metasploit · Nmap · Nessus · Hydra

Infrastructure: VMware ESXi · vCenter · Windows Server · Linux

Scripting: Python · PowerShell · Bash · REST APIs · JSON · YAML

PROJECTS

Sentinel SOC Lab · KQL · CrowdStrike · Defender XDR · AWS · GCP · Okta · Palo Alto · MITRE

Github - 2026

- Triaged a simulated multi-stage enterprise incident across Microsoft Sentinel, CrowdStrike EDR, Palo Alto, Okta, AWS CloudTrail, and GCP - correlating signals across 6 sources to validate true positives.
- Investigated phishing, credential dumping, lateral movement, C2 beaconing, MFA manipulation, and IAM abuse through iterative KQL querying across noisy telemetry with obscured event sequencing.
- Tuned behavioral detection rules across endpoint, network, identity, and cloud sources - reducing false positives and distinguishing true positives across simultaneous automated attack events.

- Reconstructed a 24-technique MITRE ATT&CK attack timeline from ambiguous concurrent logs using attack-chain reasoning rather than timestamps - simulating real SOC triage under incomplete data.

Splunk Home Labs · SPL · MITRE · Sigma · Active Directory · DNS · Kali · Metasploit · Sysmon *Github - 2026*

- Built and administered a Windows Active Directory home lab using Windows Server 2022, Windows 10 endpoints, Splunk Enterprise, Sysmon, and Kali Linux to simulate attacker activity and SOC-style security investigations.
- Triageed and investigated simulated security alerts including Meterpreter reverse shells, RDP brute-force attempts, PowerShell execution, persistence techniques, and DNS tunneling, validating true positives and reducing false positive noise through SPL query refinement.
- Performed multi-source alert investigation across endpoint, authentication, and DNS telemetry, correlating ambiguous Sysmon events to reconstruct likely attack chains and identify confirmed indicators of compromise.
- Developed and iterated on detection logic using SPL queries to improve alert fidelity and coverage of common attack behaviors observed during simulated intrusion scenarios.

Splunk BOTS Labs · SPL · Sigma · Suricata IDS · Fortigate Firewall · Windows Event Logs · Stream Logs *Github - 2026*

- Conducted security investigations simulating enterprise intrusions (Cerber ransomware and Joomla web server compromise) across Sysmon, Suricata IDS, Fortigate, DNS, Windows Registry, and HTTP telemetry.
- Triageed and analyzed multi-stage attack activity from initial access through command-and-control, identifying malicious processes, SMB-based encryption behavior, credential brute-force attempts, web shells, and persistence mechanisms through cross-source log correlation.
- Produced structured incident-style reports documenting attack timelines, indicators of compromise, and detection findings to support SOC investigation workflows and validate security event behavior.

Python - Splunk/VirusTotal Triage Script · Python · Splunk REST API · VirusTotal API · SOAR *Github - 2026*

- Developed a Python-based automation workflow using the Splunk REST API to query and analyze Windows authentication failure events (EventCode 4625), identifying patterns of suspected brute-force activity by source IP.
- Integrated VirusTotal threat intelligence enrichment to assess external IP reputation, ASN data, and malicious scoring, improving analyst visibility during RDP brute-force investigations.
- Generated structured investigation outputs with IP filtering and automated enrichment steps to support faster SOC triage and reduce manual correlation effort during security alert analysis.

SOAR Playbook - Okta MFA Response · Azure · Microsoft Sentinel · Logic Apps · Incident Response *Github - 2026*

- Developed a Microsoft Sentinel SOAR playbook to support incident response for suspected Okta MFA takeover activity by extracting incident entities and enriching alerts with VirusTotal threat intelligence.
- Automated alert enrichment and notification workflows using Azure Logic Apps to streamline SOC triage, providing analysts with structured threat context and reducing manual investigation effort.
